

'AcusticA'

It is an armchair /bed with music which exploits the most advanced technology . Sound is transformed into vibrations that are transmitted to the body in a selective way according to the frequencies, through specific technology which goes beyond the limits of ordinary sound transmitters.

“ **AcusticA**” transforms music into an authentic cellular massage (vibro-acustic therapy) which acts in tune to the musical frequencies on all aspects of the mind and body, carrying the person into a psycho-physical flow which rebalances tension and leaves a deep sense of wellbeing.

This therapy was created by combining the traditional craft techniques of lutemaking with the most innovating forms of technology in the field of sound research.

We are talking not just about a relaxation bed with sound transmitters or about a sub-woofer, but about an instrument capable of resonating into every cell of our bodies in relation to sound frequencies by way of the physical harmonization and transmission of sound.

The result is that of a deep cellular massage which involves all muscular tissues and all nerve endings in our bodies.

The vibro-acustic therapy

We are talking here about a new utilization of music in the physical-vibrational sense. We all know that music can be used in the therapeutic sense of 'music therapy' but not everyone is aware that music,as well as having an emotional effect, has also a physiological effect on the human body.

Riccardo Della Ragione

A music therapist, composer and proprietor of 'Magic Music sas', after having created and directed a scientific medical team who worked with him on the possible applications of vibro-acoustic therapy, produced a chaise-longue (armchair/bed) capable of creating a body playback corresponding to the musical frequencies.

How it works

The person lies down on the harmonic resonance outlet of the armchair/bed just as though he/she were lying on top of a large guitar and in this way he/she is struck by the musical vibration emitted by the music which is reproduced through a digital player. The chaise-longue "AcousticA" then conducts the music through bone tissue, muscle and fibre tissue reaching in-depth levels to give beneficial results evident both physically as well as psychologically and emotionally.

Vibrational music

The analytical study of vibroacoustic therapy has brought Riccardo Della Ragione (already well known as an artist in the discographic field for his compositions and film soundtracks), to the creation of musical compositions dedicated to this new study area "vibrational music". This new approach can be defined as an evolution and an amplification of music therapy.

The criteria of the musical compositions are set by the laws of physics and by the choice of sound frequencies to give greater stimulation to the human body so that the harmony and melody are composed on this basis.
